

GLOBAL IMMERSION TO DELIVER UK'S LARGEST DIGITAL DOME DISPLAY

West Sussex, UK --- 1 August, 2007 --- Global Immersion has been contracted by INTECH Science Centre to design and develop what is set to become the largest digital dome facility in the UK.

Based in Winchester, Hampshire, INTECH Science Centre is a unique, exciting, interactive technology center that aims to promote the knowledge and understanding of science, technology, engineering and mathematics, particularly among young people. The existing theater is currently used as a 200-seat auditorium – this creation of a state-of-the-art, flexible media environment will be a valuable educational resource for the facility.

The dome will consist of a perforated aluminium screen, positioned on a 10-degree tilt. Global's Fidelity Bright system will incorporate six DLP™ projectors - providing stunning contrast, vivid color and a razor sharp viewer experience. Within the system, Media Server and Media Director will provide a powerful performance, high resolution show creation and playback facility, and will allow a diverse range of content to be quickly and easily brought onto the dome. The UniView™ interactive software visualization platform and real-time starfield database will enable science and astronomy material to be shown at its best.

The solution will also incorporate optical blending and distortion correction technologies, along with leading-edge theater control software. Upon completion, the new facility will also be used as the UK base to showcase Global Immersion's fulldome technology capability.

Phil Winfield, Director, INTECH Science Centre remarked, "This is a really exciting and innovative project that will enthral our school and public visitors. Global Immersion was chosen to deliver the planetarium programme because we were impressed by their capabilities and dynamic approach; we have already built up a strong working relationship which I am convinced will lead to further innovation."

Martin Howe, Chief Executive, Global Immersion, has been closely involved in the project. He commented, "Right from the beginning we worked with the team at Intech to design a solution that would not only meet their current requirements, but also provide them with a flexible and future-proof educational resource. This local partnership is highly important for us as it enables us to strategically experiment with our latest ideas and innovations."
